

Lecture 3: Drawing monoidal categories

Outline : • diagrams for monoidal categories

• duals

• Trace, braided and symmetric monoidal categories

• Monoid objects and Frobenius objects.

Recall the definition of a monoidal category :

• category \mathcal{C}

• bifunctor $\otimes: \mathcal{C} \times \mathcal{C} \rightarrow \mathcal{C}$

• natural isomorphisms

$$\alpha_{x,y,z}: (x \otimes y) \otimes z \xrightarrow{\sim} x \otimes (y \otimes z) \quad \text{associator}$$

$$l_x: 1 \otimes x \xrightarrow{\sim} x \quad \text{left unitar}$$

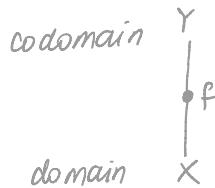

$$r_x: x \otimes 1 \xrightarrow{\sim} x \quad \text{right unitar}$$

satisfying \square and \triangledown

"Diagrams" are graphical representations of morphisms. Why care?

Diagrams for morphisms

- $f: X \rightarrow Y$

$$id_X = \begin{array}{c} X \\ | \\ X \end{array}$$

; identity of composition

- composition

e.g. $f: X \rightarrow Y$, $g: Y \rightarrow Z$

sensible because

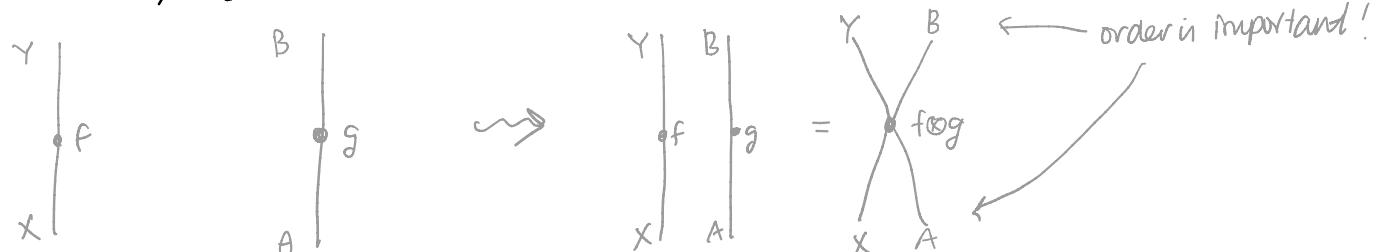

$$id_Y \circ f = f = f \circ id_X$$

$$\begin{array}{ccc} \begin{array}{c} Z \\ | \\ Y \\ | \\ X \end{array} & = & \begin{array}{c} Y \\ | \\ X \end{array} & = & \begin{array}{c} Y \\ | \\ X \end{array} \\ \text{commutative diagram} & & & & \left(\begin{array}{ccccc} & f & & id_Y & \\ X & \xrightarrow{f} & Y & \downarrow & Y \\ id_X & \downarrow & f & \nearrow & id_Y \\ X & \xrightarrow{f} & Y & & \end{array} \right) \end{array}$$

we can think of objects X as ... the identity $id_X = \boxed{\quad}$

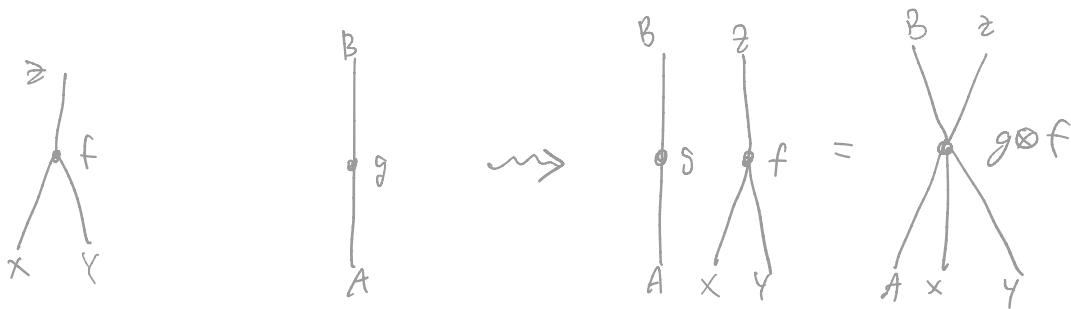

- Tensor product , the feature of monoidal categories

eg $f: X \rightarrow Y$, $g: A \rightarrow B$ then $f \otimes g: X \otimes A \rightarrow Y \otimes B$

(we restrict to strict monoidal categories)

eg. $f: X \otimes Y \rightarrow Z$, $g: A \rightarrow B$ then $g \otimes f: A \otimes X \otimes Y \rightarrow B \otimes Z$

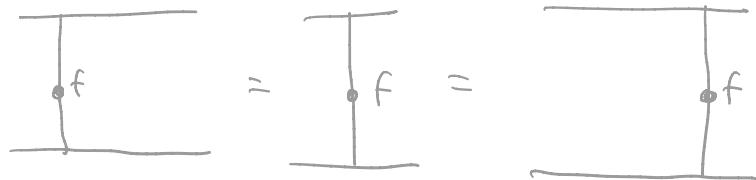

• Identity of tensor product

$$\text{id}_{\mathbb{1}} = \underline{\quad}$$

sensible because (in a strict monoidal cat.)

$$f \otimes \text{id}_{\mathbb{1}} = f = \text{id}_{\mathbb{1}} \otimes f$$

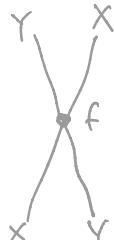

commutative diagram
(first equality)

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ r_X \parallel & & \parallel r_Y \\ X \otimes \mathbb{1} & \xrightarrow{f \otimes \text{id}_{\mathbb{1}}} & Y \otimes \mathbb{1} \end{array}$$

by naturality of $r: - \otimes \mathbb{1} \rightarrow \text{id}$

• More examples

$$f: X \otimes \mathbb{1} \otimes Y \rightarrow \mathbb{1} \otimes Y \otimes X , \quad g: X \rightarrow \mathbb{1}$$

$$, \quad h: \mathbb{1} \rightarrow A \otimes B$$

- Bifunctionality implies, for $f:A \rightarrow B$, $g:C \rightarrow D$,

$$\begin{array}{c}
 \begin{array}{cc}
 B & D \\
 | & | \\
 f \bullet & g \bullet \\
 A & C
 \end{array}
 = \begin{array}{cc}
 B & D \\
 | & | \\
 f \bullet & g \bullet \\
 A & C
 \end{array}
 = \begin{array}{cc}
 B & D \\
 | & | \\
 f \bullet & g \bullet \\
 A & C
 \end{array}
 \end{array}
 \quad \text{"Interchange law"}$$

- Exercise Draw the corresponding commutative diagram to check this

Exercise Show that the two interpretations of the following agree

$$\begin{array}{ccc}
 g \bullet & & g' \bullet \\
 | & & | \\
 f \bullet & & f' \bullet
 \end{array}$$

Exercise Show the following relation $\uparrow_f \downarrow_g = \downarrow_g \uparrow_f = \downarrow_g \uparrow_f$

- We have "Rectilinear isotopy"

Example 1

The symmetric category Sym is a (strict symmetric) monoidal category objects generated by tensor products of \bullet .

The morphisms are generated by

↑ using horizontal and vertical concatenation
and identity morphism

under the local relations

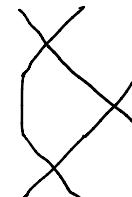

↖ can be applied to subdiagrams

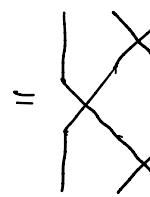

$=$

,

$=$

and with rectilinear isotopy, ie. diagrams similar to

$$\times \times := \begin{array}{c} \diagup \\ \diagdown \end{array} \times = \begin{array}{c} \diagdown \\ \diagup \end{array} \times$$

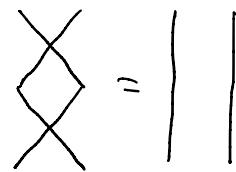

Example 1 (cont.)

Notice: all morphisms in Sym are endomorphisms

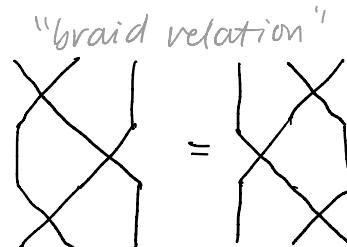

In fact we have $\text{End}(1^{\otimes n}) \cong S_n \dots$

represents transposition $s \in S_2$

$$s^2 = 1$$

$\times \times$ doesn't exist in S_n ,
we define it to be one of these

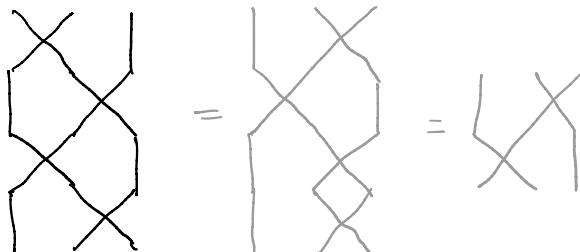

$$s_1 s_3 = s_3 s_1$$

This mirrors the Coxeter presentation of S_n (the other generators are tensors of s with identity and other relations follow by locally applying these, and rectilinear isotopy)

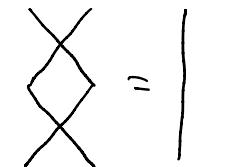

Example 1 (cont.)

Let's simplify the following morphism

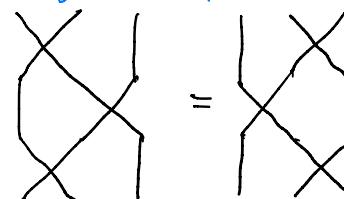

$$(12)(23)(12)(23) = (23)(12)(23)(23) = (23)(12)$$

we can also do this by looking where the strands connect

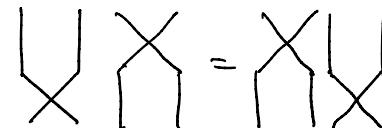

$$s^2 = 1$$

"braid relation"

$$s_1 s_2 s_1 = s_2 s_1 s_2$$

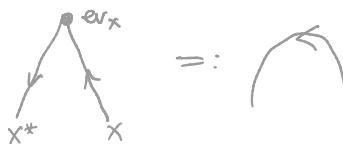

$$s_1 s_3 = s_3 s_1$$

Duals

- Let X^* be left dual of X . Recall this is defined by morphisms

$$ev_X : X^* \otimes X \rightarrow \mathbb{1}$$

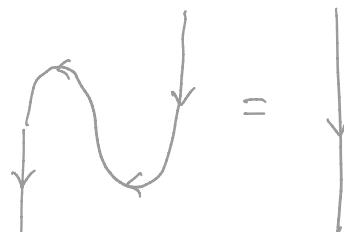

$$coev_X : \mathbb{1} \rightarrow X \otimes X^*$$

such that these triangles commute

$$\begin{array}{ccc} X & \xrightarrow{coev_X \otimes id_X} & X \otimes X^* \otimes X \\ & \searrow & \downarrow id_X \otimes ev_X \\ & X & \end{array}$$

$$\begin{array}{ccc} X^* & \xrightarrow{id_{X^*} \otimes coev_X} & X^* \otimes X \otimes X^* \\ & \searrow & \downarrow ev_X \otimes id_{X^*} \\ & X^* & \end{array}$$

"zig-zag relations"

- if X is also a left dual of X^* (ie X, X^* are biadjoint) we have

$$ev = \begin{array}{c} \nearrow \\ x \end{array} \curvearrowright \begin{array}{c} \searrow \\ x^* \end{array}$$

$$coev = \begin{array}{c} \nearrow \\ x^* \end{array} \curvearrowright \begin{array}{c} \searrow \\ x \end{array}$$

and

$$\begin{array}{c} \nearrow \\ x \end{array} \curvearrowright \begin{array}{c} \nearrow \\ x^* \end{array} = \begin{array}{c} \uparrow \end{array} = \begin{array}{c} \nearrow \\ x^* \end{array} \curvearrowright \begin{array}{c} \nearrow \\ x \end{array}, \quad \begin{array}{c} \downarrow \\ x^* \end{array} \curvearrowright \begin{array}{c} \downarrow \\ x \end{array} = \begin{array}{c} \downarrow \end{array} = \begin{array}{c} \downarrow \\ x \end{array} \curvearrowright \begin{array}{c} \downarrow \\ x^* \end{array}$$

- if X is self dual, $\dagger = \dagger$ so we can omit the arrows. Then

$$ev_x = \begin{array}{c} \nearrow \\ x \end{array} \curvearrowright \begin{array}{c} \searrow \\ x \end{array}, \quad coev_x = \begin{array}{c} \nearrow \\ x^* \end{array} \curvearrowright \begin{array}{c} \searrow \\ x \end{array}$$

and

$$\begin{array}{c} \nearrow \\ x \end{array} \curvearrowright \begin{array}{c} \nearrow \\ x^* \end{array} = \begin{array}{c} \uparrow \end{array} = \begin{array}{c} \nearrow \\ x^* \end{array} \curvearrowright \begin{array}{c} \nearrow \\ x \end{array}$$

Isotopy

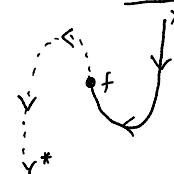

- We saw a glimpse of equivalence under true isotopy with $\text{Lg} = f = \text{Rg}$, $\text{Lg} = f = \text{Rg}$
- With more conditions we can view diagrams under general isotopy...

Suppose X, X^* are biadjoint and likewise with Y, Y^*

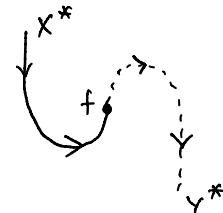

(\uparrow, \downarrow)

(\downarrow, \uparrow)

DEF Let $f: X \rightarrow Y$ be a morphism. Then the left dual of f is $f^*: Y^* \rightarrow X^*$ defined to be

and the right dual of f is ${}^*f: Y^* \rightarrow X^*$ defined to be

If $f^* = {}^*f$, we say f is cyclic and draw

$$f^* = \begin{array}{c} \curvearrowleft \\ \curvearrowright \end{array} = \begin{array}{c} \curvearrowright \\ \curvearrowleft \end{array}$$

• In general, morphisms need not be cyclic

PROP (Intro to Soergel Bimodules Prop 7.18)

In a monoidal category where all objects are biduals and all morphisms are cyclic, diagrams up to isotopy unambiguously represent a morphism.

This is what we wanted!

Remark: We could say that "rigid" in tensor category definition is so that we get closer to this desirable property.

Example 2

The Temperley-Lieb category TL_1 is a (strict) monoidal category with objects generated by \bullet , morphisms generated by

$$\cap : \bullet \otimes \bullet \rightarrow \mathbb{1} \quad , \quad \cup : \mathbb{1} \rightarrow \bullet \otimes \bullet$$

with relations

$$\cap = | = \cup \quad , \quad \circ = \text{id}_{\mathbb{1}}$$

Note this implies that \bullet is self dual

Let's simplify this morphism

A diagram illustrating the simplification of a morphism. It shows three stages of a loop configuration separated by equals signs. Stage 1: A complex arrangement of loops forming a figure-eight-like shape. Stage 2: The loops have been partially simplified, appearing as two separate components. Stage 3: The loops are fully simplified into a single vertical line segment with a small loop attached to its right side.

Example 2 (cont.)

Exercise Show that \mathcal{TL}_1 is rigid and pivotal. Draw their defining morphisms and relations.

- In fact every object is self dual, in particular biadjoint, and all morphisms are cyclic, so we have general isotopy on \mathcal{TL}_1 !
 - ↑ Ex. convince yourself of this
- Remark We can construct \mathcal{TL}_{-2} by making this category \mathbb{C} -linear and setting $\mathbb{O} = -2 \text{id}_\mathbb{I}$. Then \mathcal{TL}_{-2} is equivalent to the category with objects $V^{\otimes n}$ (where $V = \mathbb{C}^2$ is the standard representation of $SL(2, \mathbb{C})$) and morphisms being all $SL(2, \mathbb{C})$ -equivariant morphisms between them.

An aside on 2-category diagrams

- The typical example is Cat , category of (small) categories

strand = functor

dots = natural transformation

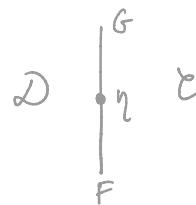

vertical stacking = vertical composition

horizontal concatenation = horizontal composition

and

regions = categories (objects in Cat)

- e.g. natural transformation $\eta: F \rightarrow G$ between functors $F, G: \mathcal{C} \rightarrow \mathcal{D}$ is drawn

- All the things we did before also extends to this context

- Including isotopy, replacing left/right duals with left/right mates

- Monoidal categories is a special case: a 2-category with one object.

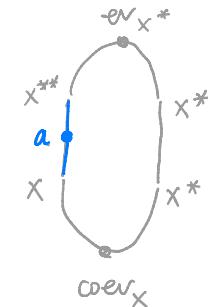

Filling in some missing diagrams from Lecture 2...

Trace (in rigid categories)

- \mathcal{C} rigid category ; $X \in \mathcal{C}$

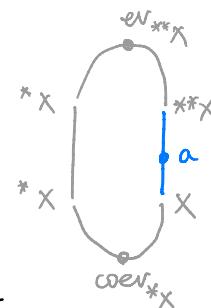

- The left trace of $a : X \rightarrow X^{**}$ is

$$Tr^L(a) : \mathbb{1} \xrightarrow{\text{coev}_X} X \otimes X^* \xrightarrow{a \otimes \text{id}_{X^*}} X^{**} \otimes X^* \xrightarrow{\text{ev}_{X^*}} \mathbb{1}$$

- The right trace of $a : X \rightarrow X^{**}$ is

$$Tr^R(a) : \mathbb{1} \xrightarrow{\text{coev}_X} {}^*X \otimes X \xrightarrow{\text{id}_{X^*} \otimes a} {}^*X \otimes X^{**} \xrightarrow{\text{ev}_{X^{**}}} \mathbb{1}$$

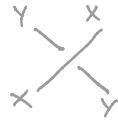

- Putting pivotal structure map gives dimension of correspond. object

Example in $T\mathcal{L}_1$, the generating object is self dual so

$$\dim(\bullet) = Tr^L(\mathbb{1}) = \boxed{1} = 1$$

Braided monoidal Categories

A braiding $c_{x,y} : X \otimes Y \rightarrow Y \otimes X$ is

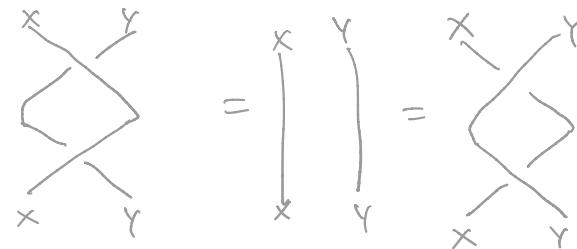

with inverse

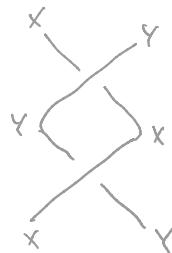

This is sensible since

$$c_{x,y}^{-1} \circ c_{x,y} = \text{id}_{X \otimes Y} = c_{x,y} \circ c_{x,y}^{-1}$$

and $c_{y,x} \circ c_{x,y}$ is not necessarily the identity

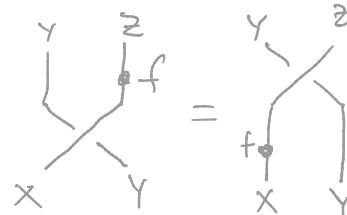

Braided Mon.Cat. (cont.)

- Naturality of the braiding , for $f: X \rightarrow Z$, $g: Y \rightarrow Z$

$$\begin{array}{ccc} X \otimes Y & \xrightarrow{c_{X,Y}} & Y \otimes X \\ f \otimes id_Y \downarrow & & \downarrow id_Y \otimes f \\ Z \otimes Y & \xrightarrow{c_{Z,X}} & Y \otimes Z \end{array}$$

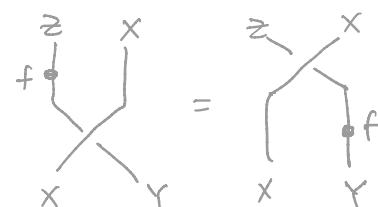

$c_{Z,X}$

"sliding dot
past a crossing"

$$\begin{array}{ccc} X \otimes Y & \xrightarrow{c_{X,Y}} & Y \otimes X \\ id_X \otimes f \downarrow & & \downarrow f \otimes id_X \\ X \otimes Z & \xrightarrow{c_{X,Z}} & Z \otimes X \end{array}$$

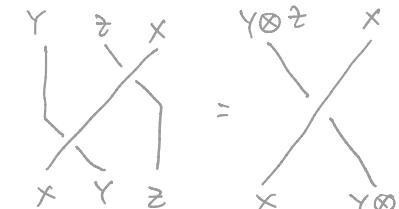

$c_{X,Z}$

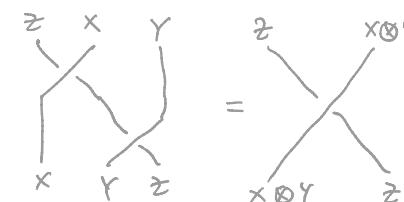

Braided Mon.Cat. (cont.)

- Hexagonal commuting diagrams

$$\begin{array}{ccc}
 x \otimes (y \otimes z) & \xrightarrow{c} & (y \otimes z) \otimes x \\
 \alpha \swarrow \quad \searrow & & \swarrow \quad \searrow \\
 (x \otimes y) \otimes z & & y \otimes (z \otimes x) \\
 c \downarrow & & c \downarrow \\
 (y \otimes x) \otimes z & \xrightleftharpoons{\alpha} & y \otimes (x \otimes z)
 \end{array}$$

$$\begin{array}{ccc}
 (x \otimes y) \otimes z & \xrightarrow{c} & z \otimes (x \otimes y) \\
 \alpha \swarrow \quad \searrow & & \swarrow \quad \searrow \\
 x \otimes (y \otimes z) & & (z \otimes x) \otimes y \\
 c \downarrow & & c \downarrow \\
 x \otimes (z \otimes y) & \xrightleftharpoons{\alpha} & (x \otimes z) \otimes y
 \end{array}$$

Braided Mon.Cat. (cont.)

- We assumed strictness so we have Yang-Baxter equation

$$(c_{Y,z} \otimes \text{id}_X) \circ (\text{id}_Y \otimes c_{X,z}) \circ (c_{X,Y} \otimes \text{id}_Z) = (\text{id}_Z \otimes c_{X,Y}) \circ (c_{X,z} \otimes \text{id}_Y) \circ (\text{id}_X \otimes c_{Y,z})$$

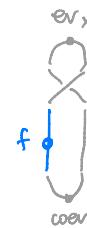

"moving a crossing under a strand"

Exercise Prove this using naturality and hexagon relations.

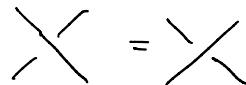

- Trace (for rigid braided), for $f: X \rightarrow X$

$$\text{tr}^L(f): \mathbb{1} \xrightarrow{\text{coev}_X} X \otimes X^* \xrightarrow{f \otimes X^*} X \otimes X^* \xrightarrow{c_{X,X^*}} X^* \otimes X \xrightarrow{\text{ev}_X} \mathbb{1}$$

Symmetric Mon. Cat.

This happens when $c_{x,y}^{-1} = c_{y,x}$

so we just write

Then the braided category relations become

- = | |

- = , =

- =

- =

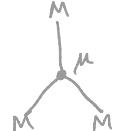

- = "braid relation"

Example

Monoid, Comonoid, Frobenius objects

DEF A monoid object in a monoidal category $(\mathcal{C}, \otimes, \mathbb{1})$ is a triple (M, μ, η) with $M \in \mathcal{C}$ an object, and morphisms

$\mu: M \otimes M \rightarrow M$ "multiplication", $\eta: \mathbb{1} \rightarrow M$ "unit"

such that the following commute

$$(M \otimes M) \otimes M \xrightarrow{\alpha} M \otimes (M \otimes M)$$

$$\begin{array}{ccc} \downarrow \mu \otimes id_M & & \downarrow id_M \otimes \mu \\ M \otimes M & & M \otimes M \\ \downarrow \mu & & \downarrow \mu \\ M & & M \end{array}$$

$$\begin{array}{ccccc} \mathbb{1} \otimes M & \xrightarrow{\eta \otimes id_M} & M \otimes M & \xleftarrow{id_M \otimes \eta} & M \otimes \mathbb{1} \\ \downarrow \epsilon_M & & \downarrow \mu & & \downarrow r_M \\ M & & M & & M \end{array}$$

(assuming strict)

$$\begin{array}{c} \text{String diagram: } M \xrightarrow{\mu} M \\ = \\ \text{String diagram: } M \xrightarrow{\mu} M \end{array}$$

$$\begin{array}{c} \text{String diagram: } M \xrightarrow{\mu} M \\ = \\ \text{String diagram: } M \xrightarrow{\mu} M \\ = \\ | \end{array}$$

Monoid, Comonoid, Frobenius objects (cont.)

Examples

① A monoid object M in Set ($\otimes = \text{cartesian prod}$, $\mathbb{1} = \{\ast\}$) is a monoid in the usual sense

- $\mu: M \times M \rightarrow M$ is an associative binary op. on M

$$\begin{array}{c} \nearrow \\ \mu \\ \searrow \end{array} = \begin{array}{c} \nearrow \\ \mu \\ \searrow \end{array}$$

- $\eta: \{\ast\} \rightarrow M$ picks an identity element from the set

and

$$\begin{array}{c} \eta \circ \begin{array}{c} \nearrow \\ \mu \\ \searrow \end{array} = \begin{array}{c} \nearrow \\ \mu \\ \searrow \end{array} \circ \eta = \end{array} \Big|$$

says that this element is indeed identity of μ

② A monoid object in Cat (small categories ; $\otimes = \text{cartesian product}$, $\mathbb{1} = \text{trivial 1-object category}$) is a (small) monoidal category

Exercise check the commutative diagrams work out

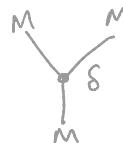

Monoid, Comonoid, Frobenius objects (cont.)

- ③ A monoid object in Ab (abelian groups ; $\otimes := \otimes_{\mathbb{Z}}$, $1 = \mathbb{Z}$) is a ring (with identity)
- ④ A monoid object in Vect_k (f.d. k -vector spaces ; $\otimes := \otimes_k$, $1 = k$)
is a unital associative algebra
- ⑤ A monoid object in $\text{End}(\mathcal{C})$ (category of endofunctors of \mathcal{C} ; $\otimes = \text{horizontal composition}$,
 $1 = \text{id}_{\text{id}_{\mathcal{C}}}$)
is a monad.

Monoid, Comonoid, Frobenius objects (cont.)

DEF A comonoid object in a monoidal category $(\mathcal{C}, \otimes, \mathbb{1})$ is a triple (M, δ, ε) with $M \in \mathcal{C}$ an object, and morphisms

$$\delta: M \rightarrow M \otimes M \text{ "comultiplication"}, \quad \varepsilon: M \rightarrow \mathbb{1} \text{ "counit"}$$

such that the following commute

$$(M \otimes M) \otimes M \xrightarrow{\alpha} M \otimes (M \otimes M)$$

Diagram illustrating the compatibility of δ with the monoidal product \otimes :

- Top horizontal arrow: $(M \otimes M) \otimes M \xrightarrow{\alpha} M \otimes (M \otimes M)$
- Left vertical arrow: $M \otimes M \xrightarrow{\delta \otimes id_M} M \otimes (M \otimes M)$
- Right vertical arrow: $M \otimes M \xleftarrow{id_M \otimes \delta} M \otimes (M \otimes M)$
- Bottom horizontal arrow: $M \xrightarrow{s} M \otimes M$
- Bottom-left diagonal arrow: $M \xrightarrow{\delta} M \otimes M$
- Bottom-right diagonal arrow: $M \xrightarrow{s} M \otimes M$

(assuming strict)

$$\delta \circ \delta = \delta \circ \delta$$

Diagram illustrating the coassociativity of δ :

The diagram shows two identical configurations of three nodes connected by four edges. Each configuration has a top node labeled δ , a middle node labeled δ , and a bottom node labeled δ . The edges connect the top node to the middle node, the middle node to the bottom node, and the top node to the bottom node.

$$\mathbb{1} \otimes M \xleftarrow{\varepsilon \otimes id_M} M \otimes M \xrightarrow{id_M \otimes \varepsilon} M \otimes \mathbb{1}$$

Diagram illustrating the compatibility of ε with the monoidal product \otimes :

- Top horizontal arrow: $\mathbb{1} \otimes M \xleftarrow{\varepsilon \otimes id_M} M \otimes M \xrightarrow{id_M \otimes \varepsilon} M \otimes \mathbb{1}$
- Left vertical arrow: $M \otimes M \xleftarrow{\ell_M^{-1}} \mathbb{1} \otimes M$
- Right vertical arrow: $M \otimes M \xrightarrow{r_M^{-1}} M \otimes \mathbb{1}$
- Bottom horizontal arrow: $M \xrightarrow{\delta} M \otimes M$

$$\varepsilon \circ \varepsilon = \varepsilon \circ \varepsilon = \mathbb{1}$$

Diagram illustrating the counit ε being a natural transformation:

The diagram shows two configurations of three nodes connected by four edges. The top configuration has a top node labeled ε , a middle node labeled ε , and a bottom node labeled ε . The bottom configuration has a top node labeled ε , a middle node labeled ε , and a bottom node labeled ε . The edges connect the top node to the middle node, the middle node to the bottom node, and the top node to the bottom node.

Monoid, Comonoid, Frobenius objects (cont.)

DEF A Frobenius object in a Monoidal category $(\mathcal{C}, \otimes, \mathbb{1})$ is a quintuple $(A, \mu, \delta, \eta, \varepsilon)$ such that

- (A, μ, η) is a monoid object
- (A, δ, ε) is a comonoid object
- the following compatibility diagram commutes

$$\begin{array}{ccccc}
 & A \otimes A & & & \\
 \swarrow \delta \otimes \text{id}_A & & \downarrow \mu & & \searrow \text{id}_A \otimes \delta \\
 (A \otimes A) \otimes A & & A & & A \otimes (A \otimes A) \\
 \downarrow \alpha & & \downarrow \delta & & \downarrow \alpha \\
 A \otimes (A \otimes A) & & A \otimes A & & (A \otimes A) \otimes A \\
 \searrow \text{id}_A \otimes \mu & & \swarrow \mu \otimes \text{id}_A & &
 \end{array}$$

(assuming strict)

Example In $T\mathcal{L}_1$, $\bullet \otimes \bullet$ is a Frobenius object with

$$\mu = \diagup \diagdown$$

$$\eta = \cup$$

$$\delta = \diagdown \diagup$$

$$\varepsilon = \cap$$

Exercise: Check the relations!
